I was recently involved with a simple project that involved emulating the functionality of some basic keyboard commands. I decided to try out the Arduino Uno board for the task since I've read posts where people used the Arduino for keyboard, mouse, and MIDI device emulation.

What would you get if you mashed up an FPGA and an Arduino? An FPGA development board with far too few output pins? Or a board in the form-factor of Arduino that's impossible to program?

The selection of the control system is left to the end user. There is a very basic open source one available though. This has been tested with grbl shield, the buildlog.net stepper shield and the ITEAD stepper shield.

These all use an Arduino as the controller.

This is going to be interesting!! We are going to assemble a finger to a small servo for testing it with an Arduino board. The servo I used on the pictures is a digital HK15298 but you can use also a cheap analog MG995 or even cheaper if you find and if the size specifications are the same.
