DC Motor Basics - ABB Group

DC motors consist of one set of coils, called armature winding, inside another set of coils or a set of permanent magnets, called the stator. Applying a voltage to the coils produces a torque in the armature, resulting

To rewind an electric motor, remove the motor's outer housing and use your hands to pull the armature out of the stator. Then, use a flat head screwdriver to pry open the tabs on the brush pads, and then cut through the wires and pull them out by hand.

Armature winding of a D.C machine is always closed and of double layer type. Closed winding Closed winding essentially means that all the coils are connected in series forming a closed circuit.

Lesson-35 : D - NPTEL

Armature Winding is the winding to which we provide electrical supply in case of a motor or from which we extract electrical supply in case of a generator. Field winding is essential for the production of magnetic field which makes it possible to convert energy from mechanical to electrical form and vice versa.

Armature Winding of DC Motor The armature winding of DC motor is attached to the rotor, or the rotating part of the machine, and as a result is subjected to altering magnetic field in the path of its rotation which directly results in magnetic losses.
